

Please download Homebrew from: <https://brew.sh>

You will need to use Spotlight Search, the Magnifying Glass, to open a program called Terminal.app in order to copy and paste in the line above.

Once Terminal starts we can open a new Window from the Shell Menu...

The Terminal window should look something like this. From here we can paste in the instructions from the Brew.sh website:

```
/bin/bash -c "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/HEAD/install.sh)"
```
